California Status Factors

Elcode  NFSM000009
Gname  ARCANGELIELLA CRASSA
Gcomname

Number of Occurrences
B  = 6 - 20
Comments  Known from at least 10 collections.

Number of Occurrences with Good Viability
B  = Very few (1-3) occurrences with good viability
C  = Few (4-12) occurrences with good viability
Comments  Several of the good collections are from Fresno Co. California, a place where I have also collected this fungus several times.

Population Size
A  = 1-50 individuals
B  = 50-250 individuals
Comments

Range Extent
D  = 1,000-5,000 km² (about 400-2,000 square miles)
Comments  Collected in the Sierra's from Fresno Co. to the Southern Cascades and over in the Siskiyou Mountains of California.

Area of Occupancy
B  = 0.4-4 km² (about 100-1,000 acres)
LB  = 4-40 km (about 2.5-25 miles)
Comments  I believe that this species is under-collected based on my own experience collecting this fungus in the Sierra's.

Long-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences
U  = Unknown. Long-term trend in population, range, area occupied, or number or condition of occurrences unknown
Comments

Short-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences
U  = Unknown. Short-term trend in population, range, area occupied, and number and condition of occurrences unknown.
Threats

B = Moderate and imminent threat. Threat is moderate to severe and imminent for a significant proportion (20-60%) of the population, occurrences, or area. Ecological community occurrences are directly impacted over a moderate area, either causing irreversible damage or requiring a long-term recovery.

Scope: Moderate  Severity: Moderate  Immediacy: Moderate

Comments: This is a mycorrizhal species; it is dependent on a host tree for its carbohydrates. Studies have shown that if the tree is killed the mycorrizhal fungi die shortly after. The one possibly saving feature of this species is the spore bank. However, nothing is known about the spore bank of this species.

Number of Appropriately Protected and Managed Occurrences

A = None. No occurrences appropriately protected and managed

Comments

Intrinsic Vulnerability

B = Moderately Vulnerable. Species exhibits moderate age of maturity, frequency of reproduction, and/or fecundity such that populations generally tend to recover from decreases in abundance over a period of several years (on the order of 5-20 years or 2-5 generations); or species has moderate dispersal capability such that extirpated populations generally become reestablished through natural recolonization (unaided by humans). Ecological community occurrences may be susceptible to changes in composition and structure but tend to recover through natural processes given reasonable time (10-100 years).

Comments

Environmental Specificity

B = Narrow. Specialist or community with key requirements common.

Comments

Other Considerations

Grank S2S4  Grank Date 11/11/2002

Endemic to California. Collected in the Sierra's from Fresno County to the Southern Cascades and over in the Siskiyou Mountains of California. Although this species is locally abundant in Fresno County California. I do not know it's status throughout the rest of it's range. However the rest of the range has not been well sampled and this species is likely more abundant that we currently know.
