

California Status Factors

Elcode NFSM000030

Gname CLAVARIADELPHUS TRUNCATUS

Gcomname

Number of Occurrences

C = 21- 80

Comments There are 30 records reported by Methven and 12 records from the OHIC database

Number of Occurrences with Good Viability

C = Few (4-12) occurrences with good viability

Comments There are 8 occurrences in protected sites.

Population Size

B = 50-250 individuals

Comments

Range Extent

F = 20,000-200,000 km² (about 8,000-80,000 square miles)

Comments This species is known from northern CA.

Area of Occupancy

B = 0.4-4 km² (about 100-1,000 acres)

LB = 4-40 km (about 2.5-25 miles)

Comments

Long-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences

U = Unknown. Long-term trend in population, range, area occupied, or number or condition of occurrences unknown

Comments

Short-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences

U = Unknown. Short-term trend in population, range, area occupied, and number and condition of occurrences unknown.

Comments

Threats

C = Substantial, non-imminent threat. Threat is moderate to severe but not imminent (> 10 years) for most of the population, occurrences, or area.

Scope High Severity High Immediacy Unknown

Comments This is a mycorrhizal species associated with coniferous forests and susceptible to logging activities.

Number of Appropriately Protected and Managed Occurrences

C = Several (4-12) occurrences appropriately protected and managed

Comments There are 8 occurrences in protected sites.

Intrinsic Vulnerability

A = Highly Vulnerable. Species is slow to mature, reproduces infrequently, and/or has low fecundity such that populations are very slow (> 20 years or 5 generations) to recover from decreases in abundance; or species has low dispersal capability such that extirpated populations are unlikely to become reestablished through natural recolonization (unaided by humans). Ecological community occurrences are highly susceptible to changes in composition and structure that rarely if ever are reversed through natural processes even over substantial time periods (> 100 years).

Comments This is a mycorrhizal species associated with coniferous forests and susceptible to logging activities.

Environmental Specificity

B = Narrow. Specialist or community with key requirements common.

Comments This is a mycorrhizal species.

Other Considerations

Edition 11/12/2002 **Edauthor** Efren Cazares

Grank S4 **Grank Date** 11/12/2002

Reasons

This is a very common species in northern coniferous forests of the world. 8 out of 30 occurrences are in protected sites. More studies are needed to determine its rarity or abundance in CA.
