Washington Status Factors

Elcode NLTEST8480
Gname DERMATOCARPON LURIDUM
Gcomname

Number of Occurrences
B = 6 - 20
Comments 7 known occurrences in Washington.

Number of Occurrences with Good Viability
B = Very few (1-3) occurrences with good viability
C = Few (4-12) occurrences with good viability
Comments

Population Size
B = 50-250 individuals
C = 250-1,000 individuals
Comments

Range Extent
C = 250-1,000 km² (about 100-400 square miles)
Comments Washington range is approximately 2,100 square miles.

Area of Occupancy
Comments Sites are small (along streams). Washington area occupies approximately 11 square miles or less (probably far less).

Long-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences
E = Relatively Stable (±25% change)
Comments

Short-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences
D = Declining. Decline of 10-30% in population, range, area occupied, and/or number or condition of occurrences
E = Stable. Population, range, area occupied, and/or number or condition of occurrences unchanged or remaining within ±10% fluctuation
Comments Decline assumed because of loss of habitat and pollution of habitat.
**Threats**

H = Unthreatened. Threats if any, when considered in comparison with natural fluctuation and change, are minimal or very localized, not leading to significant loss or degradation of populations, occurrences, or area even over a few decades’ time. (Severity, scope, and/or immediacy of threat considered Insignificant.)

**Comments**

Number of Appropriately Protected and Managed Occurrences

B = Few (1-3) occurrences appropriately protected and managed  
C = Several (4-12) occurrences appropriately protected and managed

**Comments**  
WA has 3 protected sites and four in the matrix. Matrix sites may afford protection, but silting and organic matter in streams would ruin habitat, and even with buffers, silt and slumps inevitably occur.

**Intrinsic Vulnerability**

A = Highly Vulnerable. Species is slow to mature, reproduces infrequently, and/or has low fecundity such that populations are very slow (> 20 years or 5 generations) to recover from decreases in abundance; or species has low dispersal capability such that extirpated populations are unlikely to become reestablished through natural recolonization (unaided by humans). Ecological community occurrences are highly susceptible to changes in composition and structure that rarely if ever are reversed through natural processes even over substantial time periods (> 100 years).

B = Moderately Vulnerable. Species exhibits moderate age of maturity, frequency of reproduction, and/or fecundity such that populations generally tend to recover from decreases in abundance over a period of several years (on the order of 5-20 years or 2-5 generations); or species has moderate dispersal capability such that extirpated populations generally become reestablished through natural recolonization (unaided by humans). Ecological community occurrences may be susceptible to changes in composition and structure but tend to recover through natural processes given reasonable time (10-100 years).

**Comments**  
Slow grower.

**Environmental Specificity**

A = Very Narrow. Specialist or community with key requirements scarce.

**Comments**  
Streamside or lakeside rocks where frequently wetted.

**Other Considerations**

**Greasons**

Seven populations known in Washington. Few are well protected. The species' stream/water habitat is easily polluted.
