Conservation Status Assessment

Scientific Name: Gyromitra californica
Classification: Fungus
Assessment area: Oregon

Heritage Rank: S3
Rank Date: 3/9/2017

Rank Reasons: Fair number of sites, but there are vulnerabilities.

Range Extent: F = 20,000-200,000 sq km (~8,000-80,000 sq mi)
Comments: The Oregon range is about 30,000 km. This includes the western Cascades range and the Siskiyous.

Population Size: Not assessed
Comments: None

Number of Occurrences: C = 21 - 80
Comments: There are about 40 occurrences in Oregon

Area of Occupancy: E = 26-125 4-km2 grid cells
Comments: In Oregon this species occupies about 40 grid squares.

Good Viability: C = Few (4-12) occurrences with excellent or good viability or ecological integrity
Comments: 5 occurrences are in wilderness areas that are protected from timber management.

Environmental Sensitivity: AB = Very narrow to narrow
Comments: N.Weber in 2002 ranked this as an A saying "The relative paucity of specimens of this conspicuous fungus even from suitable habitats indicates it tolerates a very narrow set of environmental parameters." however the fact that the species has a wide range that incorporates a number of forest types and ecoregions I think the "very narrow specificity" ranking was not warranted so I ranked it as AB.

Short Term Trends: Not Evaluated
Comments: None

Long Term Trends: Not Evaluated
Comments: None

Threat Impact: C = Medium
Comments: Around 75% of sites are not in protected areas and are vulnerable to effects of logging.

**Intrinsic Vulnerability:** B = Moderately vulnerable

Comments: N. Weber in 2002 ranking said “This species fruits in sites with diverse mature trees and seeps and trickles or small streams where rotting wood is plentiful. If the trees are removed and the soil dries out and the humidity falls, the survival of this species is in doubt.”

**Calculated Rank:** S3
