Comments:
In the 2002 assessment Weber said: “Mostly found in mature moist coniferous forests and typically associated with very rotten wood which may be buried. Thus ground-disturbing activities that reduce the amount of rotting wood and interrupt the addition of fresh wood to rot could impact the species. Other threats include logging, thinning, or other activities that would change the humidity, light patterns, and composition of the habitats.”

**Intrinsic Vulnerability:** Not Evaluated

**Comments:** None
