Conservation Status Assessment

Scientific Name: Phaeoclavulina abietina
Classification: Fungus
Assessment area: Global

Heritage Rank: G4
Rank Date: 4/22/2017

Assigned Rank Comments: None.

Range Extent: H = >2,500,000 sq km (> 1,000,000 sq mi)
Comments: The range of this species is well more than 2.5 million sq.km. There are sites along the coastal and cascades mountains from Alaska to Central California. There are also sites in the Rocky mountains in Alberta, Montana, Idaho, and Colorado. In eastern North America there are sites in forested areas of the Midwest from Minnesota to Iowa and Arkansas and east through Michigan, Ontario, and Quebec to New Brunswick, and south along the Appalachian Mountains to Tennessee. South of the United States there are sites in Mexico, Guatemala, and Argentina. There are also sites in Europe from England, Sweden, and Norway to Germany, Romania, and Italy. Additionally, there is a collection from China.

Population Size: Not assessed
Comments: None

Number of Occurrences: D = 81 - 300
Comments: There are about 157 known occurrences of this species. There are 115 occurrences that are documented in herbarium or agency databases with precise location data. In addition, there are about 42 other sites that are documented by herbarium collections with less precise location data.

Area of Occupancy: F = 126-500 4-km2 grid cells
Comments: This species occupies about 159 grid squares across its range.

Good Viability: D = Some (13-40) occurrences with excellent or good viability or ecological integrity
Comments: About 19 sites are in State, National, or Regional parks.

Environmental Sensitivity: C = Moderate. Generalist or community with some key requirements scarce
Comments: A decomposer of conifer debris found in forests around the world.

Short Term Trends: Not Evaluated
Comments: None

Long Term Trends: Not Evaluated
**Threat Impact:**

- **C = Medium**

  Comments:
  7 sites are in apparently unprotected sites in the Bay area. There are also sites in apparently unprotected sites in Eastern Washington that may be threatened by residential development. There are also sites in eastern North America and Europe that may be threatened by residential development. It is likely that there are between 22 (about 11%) and 60 (about 30%) sites that may be threatened by residential development. Approximately 90% of sites are not in protected areas. If those sites are logged on a 40 year rotation, around 22% would be impacted over 10 years, and around 90% would be impacted over 100 years.

**Intrinsic Vulnerability:**

- **Not Evaluated**

  Comments: None

**Calculated Rank:**

- **G4**
