California Status Factors

Elcode     NLLEC2Q010
Gname      PLATISMATIA LACUNOSA
Gcomname

Number of Occurrences
A  = 1 - 5
Comments Two occurrences are known from California.

Number of Occurrences with Good Viability
B  = Very few (1-3) occurrences with good viability
C  = Few (4-12) occurrences with good viability
Comments Sites are not located near cites.

Population Size
A  = 1-50 individuals
Comments

Range Extent
A  = <100 km² (less than about 40 square miles)
Comments Coastal northern CA.

Area of Occupancy
B  = 0.4-4 km² (about 100-1,000 acres)
C  = 4-20 km² (about 1,000-5,000 acres)
LB = 4-40 km (about 2.5-25 miles)
LC = 40-200 km (about 25-125 miles)
Comments

Long-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences
E  = Relatively Stable (±25% change)
Comments

Short-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences
E  = Stable. Population, range, area occupied, and/or number or condition of occurrences unchanged or remaining within ±10% fluctuation
Comments
**Threats**

H = Unthreatened. Threats if any, when considered in comparison with natural fluctuation and change, are minimal or very localized, not leading to significant loss or degradation of populations, occurrences, or area even over a few decades' time. (Severity, scope, and/or immediacy of threat considered Insignificant.)

<th>Moderate</th>
<th>Immediacy</th>
<th>Insignificant</th>
</tr>
</thead>
</table>

**Comments**  
Since the populations in California are so small and localized, they are intrinsically threatened. Cutting of its main substrate (alder) is a threat at all sites, since alder is often thinned even in protected riparian zones. Air pollution sensitive (McCune & Geiser 1997).

**Number of Appropriately Protected and Managed Occurrences**

C = Several (4-12) occurrences appropriately protected and managed

**Comments**  
4 protected occurrences.

**Intrinsic Vulnerability**

C = Not Intrinsically Vulnerable. Species matures quickly, reproduces frequently, and/or has high fecundity such that populations recover quickly (< 5 years or 2 generations) from decreases in abundance; or species has high dispersal capability such that extirpated populations soon become reestablished through natural recolonization (unaided by humans). Ecological community occurrences are resilient or resistant to irreversible changes in composition and structure and quickly recover (within 10 years).

**Comments**

**Environmental Specificity**

A = Very Narrow. Specialist or community with key requirements scarce.

**Comments**  
Oceanic-suboceanic. Found along riparian zones as well as in wet coastal forests.

**Reasons**

Two sites are known in California, all close together. If one site is threatened, then possibly all are. Narrow habitat range. Cutting of its main substrate (alder) is a threat at all sites, since alder is often thinned even in protected riparian zones. Air pollution sensitive (McCune & Geiser 1997).
