## **Oregon Status Factors**

Elcode NFSM000160

Gname RAMARIA SPINULOSA VAR DIMINUTIVA

**Gcomname** 

### **Number of Occurrences**

A = 1 - 5

Comments There is only 1 record in OR.

## **Number of Occurrences with Good Viability**

U = Unknown what number of occurrences with good viability

Comments This is a mycorrhizal species associated to late succesional forests. Unknow forest management

activities.

## **Population Size**

A = 1-50 individuals

Comments

## **Range Extent**

D = 1,000-5,000 km 2 (about 400-2,000 square miles)

Comments There is only one record from OR. This species is reported as R. funosiavellana in Marr and

Stuntz 1973.

### **Area of Occupancy**

A = <0.4 km 2 (less than about 100 acres)

LA = <4 km (less than about 2.5 miles)

Comments

# Long-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences

U = Unknown. Long-term trend in population, range, area occupied, or number or condition of occurrences unknown

Comments

# Short-term Trend in Population Size, Extent of Occurrence, Area of Occupancy, and/or Number or Condition of Occurrences

U = Unknown. Short-term trend in population, range, area occupied, and number and condition of occurrences unknown.

Comments

#### **Threats**

A = Substantial, imminent threat. Threat is moderate to severe and imminent for most (> 60%) of the population, occurrences, or area. Ecological community occurrences are directly impacted over a widespread area, either causing irreversible damage or requiring long term recovery

Scope High Severity High Immediacy High

Comments This is mycorrhizal species associated to late succesional forests.

## **Number of Appropriately Protected and Managed Occurrences**

A = None. No occurrences appropriately protected and managed

Comments The sites where it occurs are not protected.

## **Intrinsic Vulnerability**

A = Highly Vulnerable. Species is slow to mature, reproduces infrequently, and/or has low fecundity such that populations are very slow (> 20 years or 5 generations) to recover from decreases in abundance; or species has low dispersal capability such that extirpated populations are unlikely to become reestablished through natural recolonization (unaided by humans). Ecological community occurrences are highly susceptible to changes in composition and structure that rarely if ever are reversed through natural processes even over substantial time periods (> 100 years).

Comments This is a mycorrhizal species and susceptible to logging activities.

## **Environmental Specificity**

B = Narrow. Specialist or community with key requirements common.

Comments Mycorrhizal species

#### Other Considerations

**ORNHIC List 1** 

Edition 11/10/2002 Edauthor Efren Cazares

Grank S1? Grank Date 11/10/2002

#### **Greasons**

There is only 1 record in OR. Endemic and rare to late successional in the PNW forests. Susceptible to logging activities. More studies are needed to determine its rarity or abundance in the PNW.
